Fellowship profile:
Developing a qualitative study protocol on VA interviewer experiences in Myanmar

October 2018
Resources available from the University of Melbourne, Bloomberg Philanthropies Data for Health Initiative

CRVS development series
Concise and easily accessible, the CRVS development series form a lasting archive of synthesised evidence and knowledge on strengthening CRVS systems as generated through the Initiative. The content of this series is based on a combination of technical knowledge, country experiences, as well as the scientific literature. The series is intended to stimulate debate and ideas for in-country CRVS policy, planning and capacity building, and promote the adoption of best practice to strengthen CRVS systems world-wide.

CRVS technical outcome series
This series focuses on filling a range of scientific knowledge gaps offering new tools, methods, findings and approaches for CRVS systems and data improvement. The series has a strong empirical focus, reporting on works in progress, particularly for large or complex technical initiatives, or on specific components of projects that may be of more immediate relevance to stakeholders.

CRVS resources and tools
Capacity-building resources and tools are designed to influence and align CRVS processes with established international or best-practice standards and to help countries improve their systems. These resources, which are used extensively in the Initiative’s training courses, aim to change practice and ensure countries benefit from such changes by developing critical CRVS capacity among technical officers and ministries.

CRVS country perspectives
CRVS country perspectives describe the capacity-building experiences and successes of strengthening CRVS systems in partner countries, including fellowship reports. The series describes the state of CRVS systems improvement in partner countries and lessons learnt, and provides a baseline for comparison over time and between countries.

CRVS action guides and summaries
Many papers from the development and technical outcome series have accompanying action guides or summaries, which provide a succinct overview of key points and, in the case of action guides, a suggested way forward for countries.

Fellowship profile: Developing a qualitative study protocol on VA interviewer experiences in Myanmar

Between November 2016 and February 2017 Ms Tun Zin Mar (‘Zin’), from the Central Statistical Office of Myanmar, came to the University of Melbourne to develop a framework of analysis for a qualitative study to learn about the experiences of verbal autopsy interviewers during the initial phases of implementation. This CRVS fellowship profile documents Zin’s experiences while at Melbourne, including how she developed the protocol, how she intends to apply it, and what impact her fellowship might have on improving mortality statistics as generated through the civil registration and vital statistics system in Myanmar.

Country context

Zin is from Myanmar, a country that has shown strong political commitment to generate reliable vital statistics for health policy and planning by engaging in civil registration and vital statistics (CRVS) system-strengthening activities. In collaboration with the Bloomberg Philanthropies Data for Health (D4H) Initiative, among others, Myanmar is working toward ensuring that its 53 million people – 70 per cent of whom live in rural areas – are counted in the country’s civil registration system.1 Currently, the completeness of birth and death registration varies across Myanmar’s 15 states and regions (Figure 1). For example, overall birth registration completeness is at 72 per cent nationally, but this differs considerably between urban and rural areas – with 94 per cent in urban areas and 64 per cent in rural regions.2,3

According to the Myanmar Demographic and Health Survey, the infant mortality rate is 40 per 1,000 live births,4 while the under-five mortality rate is 50 deaths per 1,000 live births. This means that one in 20 children do not survive until their fifth birthday. Life expectancy is also low, at approximately 65 years for men and 69 years for women.5 Communicable diseases remain a significant health challenge, with high rates of tuberculosis, malaria, diarrhoeal diseases and hepatitis B.6 At the same time, many people in Myanmar are now

---

4 Ministry of Health and Sport (MOHS) and ICF. 2015-16 MDHS Key Findings. Rockville, Maryland, USA: MOHS and ICF; 2017.
dying from non-communicable diseases (NCDs) like heart disease, Alzheimer’s disease and diabetes. The probability of premature death from an NCD is 24 per cent in Myanmar, higher than the South-East Asia (23%) and global (18%) averages.\textsuperscript{7}

A major challenge for Myanmar, given how many people live in rural areas with limited access to health facilities, is to keep track of the changes in the pattern of mortality. In 2013, for example, only 14 per cent of deaths occurred in a hospital or similar health facility, and overall, less than one-quarter of all deaths had a medically certified underlying cause of death.\textsuperscript{8} However, for the Government to be able to make more targeted health policies and programs, more reliable and timely mortality data is needed, especially data on causes of death.

**Figure 1 Myanmar (with states indicated)**

The civil registration and vital statistics system in Myanmar

Myanmar’s CRVS system was established in the lower townships in the late nineteenth century, and was extended to the upper regions of the country early in the twentieth century. In this period, municipal health officers in urban areas and village headmen in rural areas were responsible for data collection. Registration officers were tasked with providing death certificates to family members of the deceased as well as collecting cause of death information in line with the Births, Deaths and Marriages Act 1888. The Towns Act 1907 and the Villages Act 1907 further decreed that any death in Myanmar must be registered, with additional legislation (such as the Yangon Municipal Act 1944) mandating that deaths must be registered prior to burial.

In 1962, Myanmar introduced a new registration system in 15 townships, and rolled this out nationally in 1984. Under this new system, the Central Statistical Organization (CSO) served as the focal department, and the Department of Public Health (DOPH) served as an implementing organisation. The CSO developed and distributed vital event forms, compiled the completed forms, and calculated vital statistics. DOPH health staff, on the other hand, registered vital events, recorded data, and issued certificates. A Health Management Information System (HMIS) was established in 1995 and integrated into the CRVS system, and the birth and death data collected by this system sent to the CSO for compilation, analysis, and dissemination.

In 2012 Myanmar enacted a national law requiring that families report births and deaths to the local general administrative office within three days of the event’s occurrence. Although this new law contains a penalty for families who fail to report a birth or death within three days of its occurrence, at present there is no penalty enforcement. Currently, the Ministry of Health and Sports (MOHS) and CSO are the main institutions responsible for Myanmar’s CRVS system. Health staff under the MOHS, such as midwives and public health supervisors, routinely collect birth and death data as part of their roles.

Civil registration and vital statistics system improvement

To align with global efforts for CRVS-strengthening, in 2016 Myanmar reformed a national-level Coordination Committee on Birth and Death Registration chaired by the Union Minister of the MOHS. This is a high-level government committee, involving participation by Director Generals from 13 ministries. The focus of this Committee is on the strategic improvement of the CRVS system, a focus which necessitates careful, intersectoral coordination among various government departments.

In addition to this committee, Myanmar has demonstrated an impressive degree of political commitment to coordinate CRVS strengthening efforts through the formation of an Internal Agency Working Group (IAWG) for Vital Registration. Formed in 2006, this group consists of technical officials across a range of government agencies to facilitate collaboration among key CRVS stakeholders to improve coverage of birth and death registration. Essential stakeholders in this group include representatives from the Department of Public Health (under the MOHS), CSO, GAD, Department of Population and Immigration, Department of Social Welfare (DSW), Department of Human Resources and Education Planning, and UNICEF.

---

Verbal autopsy

The D4H Initiative is assisting the Government of Myanmar to improve the capture and transmission of cause of death data – especially data on rural deaths – to improve the overall quality and completeness of mortality statistics. Myanmar’s CRVS improvement efforts centre around making full use of the existing midwifery system, improving on aspects of the birth and death reporting process.

Myanmar’s nearly 20,000 midwives play a critical role in the collection of data, and many of these midwives have already undergone two years of vocational training to prepare them for this role. As part of D4H, Myanmar has begun training midwives to perform verbal autopsies, or VAs, using digital tablets. The VA process involves an interview with the decedent’s family members regarding signs and symptoms prior to death (Box 1). Midwives are best-placed to conduct VAs given that they work in close contact with village populations for routine health monitoring activities like immunisations, and are often the first to know about deaths. Using tablets for collecting VA interview data, a software program for sending and storing the data, and a computer algorithm to generate a probable underlying cause of death, the CSO and MOHS can generate mortality statistics for the population, even for those deaths that have not been medically certified by a physician. Automated VA has been rolled out in 14 townships and districts in Myanmar so far, covering 2.2 million people. By 2019, it is anticipated this number will increase to 34 townships.

Box 1: What is verbal autopsy?

Verbal autopsy is a method for collecting information about an individual’s signs and symptoms prior to their death from their family or next of kin, and interpreting these to diagnose the likely or most probable cause of death. The principal purpose of a VA is to describe the cause composition of mortality through the estimation of cause-specific mortality fractions (CSMFs). Verbal autopsy also serves as a cost-effective tool for filling the gaps in mortality data. Studies suggest that VA can provide population-level cause of death data similar in quality and reliability to medical certification by physicians in hospitals.

The VA process consists of three basic steps:

1. Setting up an interview by a trained VA staff member at the household (or another appropriate place).
2. Conducting a structured interview to collect information on signs and symptoms of illnesses, and events that the deceased suffered before death.
3. Interpreting the interview data to diagnose the most probable underlying cause of death (historically, this was done by physicians, however automated methods are now widely applied).

14 For more information, see; University of Melbourne. SmartVA: Technical user guide (V1.0). CRVS resources and tools, Melbourne, Australia: Bloomberg Philanthropies Data for Health Initiative, Civil Registration and Vital Statistics Improvement, University of Melbourne, 2018.
The overall research question of Zin’s fellowship project was to understand the experiences of VA interviewers as part of early VA implementation.

Zin’s project also built on two other activities carried out in Myanmar as part of VA implementation: a feasibility assessment and the pilot test. The feasibility assessment was done in July and August 2016, and examined the knowledge, attitudes and practice of key stakeholders to investigate the feasibility of introducing verbal autopsy. Some of the key findings from the assessment were that, while midwives accepted that birth and death registration are very important, their significant workload impacts their ability to collect and send birth and death information, as well as provide health services to the community. The assessment also found that most of the midwives had not received any training on birth and death registration.

The pilot test of VA was conducted in October 2016. It found that family members may be hesitant to answer some questions in the VA interview, for example, refusing to answer questions around sensitive or stigmatised illnesses such as HIV. The pilot test also found that some people may not like to talk about the cause of death immediately after their family member has died, and on occasion the respondent may not remember or know all the signs and symptoms of the deceased when participating in the interview.

Reflections: new skills

Qualitative methods

While at the University, Zin learned about qualitative study methods, something very different to her background in statistics and quantitative methods. As Zin remarked, qualitative methods can explore the meaning behind peoples’ experiences, cultures, or particular issues. Zin also carried-out several related literature reviews to answer questions such as:

- What is the qualitative method?
- Why are qualitative methods the best approach to answer the research question?
- What is the most appropriate qualitative method(s) to use in the study protocol?
- What are their strengths and weaknesses in general?
- Are they appropriate for use in Myanmar?
- How feasible are they for this research question?
- What topics of enquiry should be covered in the study protocol?

Zin learned about focus group discussions, in-depth interviews, case studies and observational methods, and one of her first tasks was to review the strengths and weaknesses of these methods, and assess them against criteria she developed with support from the technical team at Melbourne (Box 2).
Box 2: Criteria for assessing four qualitative methods

- Time required for data collection and analysis
- Coverage and representativeness
  - Midwives and public health supervisors
  - Rural and urban areas
  - Strategic implementation areas
- Depth of information likely to be obtained
- Cost
- Required level of facilitator experience and skills
- Generalisability of results
- Diversity of topics
- Complexity

Following the literature review and assessment, she selected group discussions and in-depth interviews as the main methods for the study protocol. These were selected as Zin felt they were the most practical methods to elicit information from, and opinions of, VA Interviewers in order to assess their experiences. One-on-one in-depth interviews can elicit detailed information, while focus group discussions can be used to obtain different ideas, experiences and needs of midwives and public health supervisors in conducting VA interviews.

Developing the protocol

After her literature review on qualitative methods, Zin developed her study protocol for the focus group and in-depth interviews (Annex 1), which focused on four main areas:

1. Activities of VA interviewers
2. Characteristics of midwives and PHS-II
3. Characteristics of the states and regions where VA was being implemented
4. Additional follow-on points from results of the feasibility study and pilot test.

She also learnt about various sampling strategies, and decided that a purposive sampling strategy was the best option, as it is widely used in qualitative research and allows for sampling based on the identification and selection of potentially information-rich cases (rather than random sampling, for example). Finally, Zin learned about methods of analysis, and selected to use a content analysis approach, where transcripts of the focus groups and interviews would be analysed according to defined themes.

Implementing the study

On her return to Myanmar, Zin carried out the qualitative study, with the support of staff from the CSO. A total of six focus group discussions and nine in-depth interviews were carried out in three townships in June 2017, with data analysed between June and August. She found that most midwives and PHS-II took their new roles as VA interviewers very seriously, and on occasion, returned to a home two or three times to interview the family members.

if they were not there on the previous visits. While the interview itself took between 30 to 45 minutes, as they could do the interview with other primary health activities, and as the number of VAs conducted per month was low (between two to five interviews), they did not find it overly burdensome.

The study found that verifying certain data elements, such as date of birth of the deceased, was difficult as it was common practice for families to bury medical records and identity cards with the deceased. Certain townships also faced specific language barriers, as the midwife and PHS-II working there don’t always speak all of the local languages.

In regards to training, Zin found that while midwives were happy with the number of days of training provided, the PHS-II would have liked more. She also remarked that there seemed to ‘be a gap in linking theory and practices’, as many of the VA interviewers could describe how to perform an ethical interview, but performed poorly during actual interviews. Having more practice with the tablets, conducting role plays, and more time in the field while learning, are critical in strengthening interviewers’ skills.

Reflections: strengthening the CRVS system in Myanmar

From her time at the University and work done on developing the qualitative study protocol, Zin believes that verbal autopsy is an appropriate method to capture cause of death data for community deaths in Myanmar, and that it can provide the necessary information for health policy and planning. Early results have demonstrated that midwives and PHS-II are suitable for conducting VA interviews, but that more training, supervision and support might be necessary. Having clear roles and responsibilities for VA is critical, and these must be linked to the routine duties of staff, to ensure that data are properly collected and shared with the relevant agencies. Implementing a system of routine monitoring and evaluation will also ensure the quality of VA interviews; which in turn, will ensure the quality of the cause of death data they generate.

Acknowledgements

I had a great chance to study about qualitative methods through this fellowship, and it allowed me to contribute towards filling a technical gap in our country. I was able to apply my new knowledge and skills related to qualitative interview methods as part of the mid-term evaluation of verbal autopsy implementation in Myanmar, as part of D4H.

I would like to express grateful gratitude to Dr Wah Wah Maung, Director General, Central Statistical Organization; Professor Alan Lopez and University of Melbourne CRVS D4H team; Ms Khin Sandar Bo, Country Coordinator, D4H; and colleagues from Vital Strategies for their guidance and incredible support.

I would also like to thank Ms Sonja Firth, Technical Manager, for her support while I stayed in Melbourne, and Dr Tim Adair, Principal Research Fellow, for his close supervision and guidance in writing the study paper.
